

## Smart Epidemic Management Platform

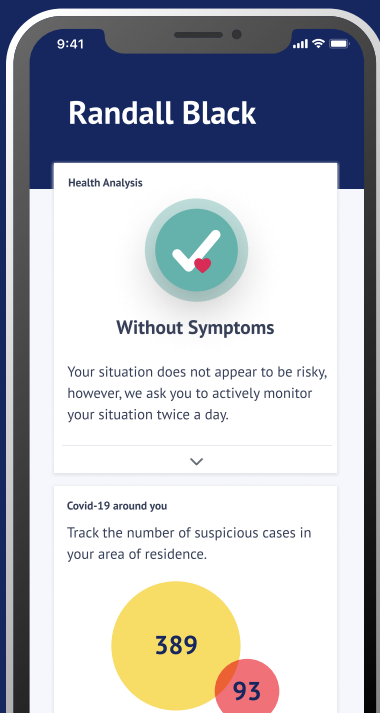

CovidApp empowers health systems and the population through education, symptom tracking and data analytics.

### About

CovidApp is a free to use social platform that allow people to track their symptoms and get a quick health evaluation.

At the same time it empowers authorities with geographical and demographic data, providing strategic analytics on how to fight the pandemic.

It also allows for doctors to manage and track their patients remotely without being exposed to risk.

### Features

#### Symptom Tracking

The platform allows users to track their symptoms and the evolution over time, empowering people and their doctors with data and metrics on their health.

#### Remote Health Monitoring

The platform offers the ability for doctors to use a real-time and collaborative backoffice dashboard to monitor patients. It offers health systems a way to monitor the population without exposing their staff to unnecessary exposure.

#### Smart Triage and Health Status Indication

Using Machine Learning and algorithms based on the WHO (World Health Organization) instructions and learning how patients evolve with their tracking, the platform is able to compute a risk factor for each user and send out alerts.

## Why Communities need Remote Monitoring

Health facilities in general are not prepared for a large scale pandemic and therefore, people won't have access to hospitals or clinics. They need to stay and recover home, but to do that in a safe and comfortable way.
